Calculation of the axial injection beam line of the U400R cyclotron

Tuesday 3 June 2025 16:00 (2 hours)

The Flerov Laboratory of Nuclear Reactions of the Joint Institute for Nuclear Research continues work on the reconstruction of the U400 cyclotron into a new U400R accelerator complex designed to produce accelerated ion beams with an atomic mass in the range of $A = 4 \div 209$ and an energy of $0.8 \div 25$ MeV/nucleon. The intensity of accelerated ions will be about $2.5 \mu\text{A}$ particles for ^{48}Ca ions. The axial injection system of the U400R cyclotron is a modernization of a similar system of the U400 cyclotron. The report presents the results of calculating the axial injection beam line of the cyclotron.
